

Education at a Glance 2023

Country note

Estonia

This country note provides an overview of the key characteristics of the education system in Estonia. It draws on data from *Education at a Glance 2023*. In line with the thematic focus of this year's *Education at a Glance*, it emphasises vocational education and training (VET), while also covering other parts of the education system. Data in this note are provided for the latest available year. Readers interested in the reference years for the data are referred to the corresponding tables in *Education at a Glance 2023*.

The output of educational institutions and the impact of learning

- High-quality VET programmes integrate learners into labour markets and open pathways for further personal and professional development. However, the quality and importance of VET programmes differ greatly across countries. In some countries, half of all young adults (25-34 year-olds) have a vocational qualification as their highest level of educational attainment, while the share is in the low single digits in other countries. In Estonia, 28% of 25-34 year-olds have a VET qualification as their highest level of attainment: 17% at upper secondary level and 11% at post-secondary non-tertiary level (Figure 1).
- Across the OECD, unemployment rates for 25-34 year-olds with vocational upper secondary attainment are lower than for their peers with general upper secondary or post-secondary non-tertiary attainment. This is not the case in Estonia, where 6.2% of young adults with vocational upper secondary attainment are unemployed, compared to 3.6% of those with general upper secondary attainment.
- Although an upper secondary qualification is often the minimum attainment needed for successful labour-market participation, some 25-34 year-olds still leave education without such a qualification. On average across the OECD, 14% of young adults have not attained an upper secondary qualification. In Estonia, the share is lower than the OECD average (10%).
- Workers in Estonia aged 25-34 with vocational upper secondary or post-secondary non-tertiary attainment earn 3% more than those without upper secondary attainment, whereas the earning advantage for workers with general upper secondary attainment is 15%. However, in almost all OECD countries, tertiary degrees provide a significantly larger earnings advantage. In Estonia, 25-34 year-old workers with bachelor's attainment (or equivalent) earn 32% more than their peers without upper secondary attainment, while those with master's or doctoral attainment (or equivalent) earn 65% more.
- Tertiary attainment continues to increase among the working age population. On average across the OECD, tertiary attainment is becoming as common as upper secondary or post-secondary non-tertiary attainment among 25-64 year-olds. In Estonia, 42% of 25-64 year-olds have tertiary attainment, a smaller share than those that have upper secondary or post-secondary non-tertiary attainment (48%).

Figure 1. Share of 25-34 year-olds whose highest level of education has a vocational orientation, by level of educational attainment (2022)

In per cent

1. Data for upper secondary attainment include completion of a sufficient volume and standard of programmes that would be classified individually as completion of intermediate upper secondary programmes (9% of adults aged 25-34 are in this group).

2. Year of reference differs from 2022. Refer to the source table for more details.

Countries are ranked in descending order of the share of 25-34 year-olds who attained vocational upper secondary, vocational post-secondary non-tertiary or vocational short-cycle tertiary education.

Source: OECD (2023), Table A1.3. For more information see *Source* section and [Education at a Glance 2023 Sources, Methodologies and Technical Notes](#) (OECD, 2023^[11]).

- On average across OECD countries, 14.7% of young adults aged 18-24 are not in education, employment or training (NEET), while in Estonia the corresponding figure is 15%. Reducing NEET rates among young adults is a particularly important challenge in all countries because those who become NEET face worse labour-market outcomes later in life than their peers who remained in education or training at this age.
- As the demand for skills in the workplace changes ever more quickly, the importance of lifelong learning continues to grow. In Estonia, the share of adults who participated in non-formal job-related education over a four-week reference period is 10% among 25-64 year-olds with vocational upper secondary or post-secondary non-tertiary attainment, 10% among those with general upper secondary attainment and 23% among those with tertiary attainment. This compares to average shares of 7% (vocational upper secondary or post-secondary non-tertiary attainment), 7% (general upper secondary or post-secondary non-tertiary attainment) and 14% (tertiary) across the OECD.

Access to education, participation and progress

- Participation in high-quality early childhood education (ECE) has a positive effect on children's well-being, learning and development in the first years of their lives. In Estonia, 64% of 2-year-olds are enrolled in ECE. This increases to 87% of 3-year-olds, 92% of 4-year-olds and 93% of 5-year-olds.
- Compulsory education in Estonia starts at the age of 7 and continues until the age of 16. Students typically graduate at age 18 from general upper secondary programmes. (Here, the typical age refers to the age of the students at the beginning of the school year; students will generally be one year older than the age indicated when they graduate at the end of the school year.) The age range for completing vocational programmes is just as wide, with students typically graduating from vocational upper secondary programmes also at age 18. This is different from most OECD countries, where graduates from vocational upper secondary programmes have a wider age range, reflecting the greater diversity of pathways into these programmes than for general ones.
- The large majority of 15-19 year-olds across the OECD are enrolled in education. In Estonia, 40% of this age group are enrolled in general upper secondary education and 15% in vocational upper secondary education. A further 27% are enrolled in lower secondary programmes and 5% in tertiary programmes. This compares to an OECD average of 37% enrolled in general upper secondary programmes, 23% in vocational upper secondary programmes, 12% in lower secondary programmes and 12% in tertiary programmes (Figure 2).
- On average across countries and other participants with comparable data, 77% of entrants into general upper secondary education successfully complete their upper secondary studies (either in general or in vocational programmes) within the theoretical duration of the programme. The completion rate increases by an average 10 percentage points within two years after the end of the theoretical duration. In Estonia, 88% of entrants into general upper secondary education complete their programme within the theoretical duration, but this share increases to 93% after allowing an additional two years.
- In most countries with available data, completion rates in vocational upper secondary programmes are lower than in general upper secondary programmes. In Estonia, 60% of vocational students complete upper secondary education (either general or vocational programmes) within the expected duration and 67% complete their programme after an additional two years. On average across countries and other participants with available data, 62% of vocational entrants complete their studies on time and 73% within an additional two years.
- In some countries, most students enrol in another education programme shortly after completing their upper secondary education. In other countries, it is common for upper secondary graduates to enter the labour market or take a gap year and return to education later. Consequently, the share of general upper secondary graduates in education one year after their graduation ranges from less than 40% in Sweden to more than 90% in Slovenia. In all countries, general upper secondary graduates are more likely to be enrolled in formal education one year after their graduation than those who graduated from a VET programme. In Estonia, 59% of general upper secondary graduates are in education one year after their graduation compared to 17% of vocational graduates.
- Bachelor's programmes are the most popular programmes for new entrants to tertiary education. On average across the OECD, they attract 76% of all new students compared to 92% in Estonia. Short-cycle tertiary programmes are the second most common level of education for new entrants into tertiary education, but their importance differs widely across countries. However, they do not exist in Estonia, as in three other OECD countries (Finland, Greece and Lithuania).

Figure 2. Enrolment rates of 15-19 year-olds, by level of education (2021)

In per cent

1. Year of reference differs from 2021: 2020 for Argentina and South Africa; 2018 for Indonesia.

2. Excludes students enrolled at tertiary levels.

3. Breakdown by age not available after 15 years old.

4. Excludes post-secondary non-tertiary education.

Countries are ranked in descending order of the share of students enrolled in upper secondary vocational education.

Source: OECD/UIS/Eurostat (2023), Table B1.2. For more information see [Source](#) section and [Education at a Glance 2023 Sources, Methodologies and Technical Notes](#) (OECD, 2023^[1]).

- Perhaps surprisingly, the share of international students at tertiary level has not been negatively affected by the COVID-19 pandemic in many OECD countries. However, a few countries experienced double digit declines in the share of international students. Estonia is not one of them, as the share of international students increased from 11% of all tertiary students in 2019 to 12% in 2021.

Financial resources invested in education

- All OECD and partner countries devote a substantial share of their domestic output to education. In 2020, OECD countries spent on average 5.1% of their gross domestic product (GDP) on primary to tertiary educational institutions. In Estonia, the corresponding share was 4.8% of GDP, of which 37% was dedicated to primary education, 18% to lower secondary education, 12% to upper secondary education, 2% to post-secondary non-tertiary education and 32% to bachelor's, master's and doctoral or equivalent programmes (Figure 3).

Figure 3. Total expenditure on primary to tertiary educational institutions, by level of education (2020)

In per cent

1. Year of reference differs from 2020. Refer to the source table for more details.

2. Upper secondary vocational programmes include lower secondary vocational programmes.

3. Upper secondary programmes include lower secondary programmes.

4. Primary education includes pre-primary programmes.

Countries are ranked in descending order of total expenditure on primary and lower secondary institutions.

Source: OECD/UIS/Eurostat (2023), Table C2.1. For more information see [Source](#) section and [Education at a Glance 2023 Sources, Methodologies and Technical Notes](#) (OECD, 2023^[1]).

- Funding for education in absolute terms is strongly influenced by countries' income levels. Countries with higher per capita GDP tend to spend more per student than those with lower per capita GDP. Across all levels from primary to tertiary education, Estonia spends USD 11 088 annually per full-time equivalent student (adjusted for purchasing power), compared to the OECD average of USD 12 647. Expenditure per student is equivalent to 28% of per capita GDP, which is slightly above the OECD average of 27%.
- The COVID-19 pandemic has created unprecedented challenges for education systems across the world. On average across the OECD, expenditure on primary to tertiary educational institutions per full-time equivalent student (including expenditure on research and development) grew by 0.4% from 2019 to 2020 (the first year of the pandemic and the latest period with available data). In Estonia, it increased by 0.5%. This change in expenditure per student is the result of total expenditure on educational institutions increasing by 2% and the total number of full-time equivalent students increasing by 1.6%.

- The distribution of spending between general and vocational upper secondary programmes depends on a variety of factors, such as the number of VET students, the fields of study within VET programmes and the importance given to VET relative to general programmes. In Estonia, 6% of all funding for educational institutions is spent on general upper secondary education and 6% on vocational upper secondary education (11% and 10% respectively on average across the OECD).
- Government sources dominate non-tertiary education funding in all OECD countries, while the private sector contributes 9% of the total expenditure on educational institutions on average. Private funding in Estonia accounted for 3% of expenditure at primary, secondary and post-secondary non-tertiary levels.
- In most countries, private sources accounted for similar shares of expenditure on general and vocational programmes at upper secondary level. However, in a few countries the differences in the share of private funding between general and vocational programmes were wider. In Estonia, the private sector is responsible for 5% of expenditure on general upper secondary programmes and 3% of expenditure on vocational upper secondary programmes.
- On average across OECD countries, more than half of government expenditure on primary to post-secondary non-tertiary education comes from subnational governments. In Estonia, 32% of the funding comes from the central government, after transfers between government levels and 68% from the local level.

Teachers, the learning environment and the organisation of schools

- The total compulsory instruction time throughout primary and lower secondary education varies widely from country to country (Figure 4). Across the OECD, over the course of primary and lower secondary education, compulsory instruction time totals an average of 7 634 hours, distributed over nine grades. In Estonia, the total compulsory instruction time is lower, at 6 431 hours, over nine grades.
- On average across OECD countries, 25% of the compulsory instruction time in primary education is devoted to reading, writing and literature and 16% to mathematics. In lower secondary education, the share is 15% for reading, writing and literature and 13% for mathematics. In Estonia, 23% of time is devoted to reading, writing and literature and 15% to mathematics at primary level compared to 13% and 14% at lower secondary level.
- Besides average teacher salaries themselves, annual teaching time requirements, annual hours of compulsory instruction time for students, and class size also impact total spending on teacher salaries. When combined, these factors can be used to estimate an average cost of salaries per student and show the relative impact of each individual factor on total salary spending. Total teacher salary costs per primary student are USD 2 541 in Estonia, lower than the OECD average of USD 3 614. This difference can be broken down into these four factors: lower teacher salaries reduce costs (by USD 1 207), below-average teaching hours increase costs (by USD 793), below-average student instruction time reduces costs (by USD 591) and larger classes reduce costs (by USD 69). Between 2015 and 2021, the salary cost of teachers per student increased by 42% in Estonia (from USD 1 784 to USD 2 541).
- On average across OECD countries, in full-time equivalent terms, there are 14 students for every teaching staff member in general upper secondary programmes and 15 students per staff member in vocational upper secondary programmes. In Estonia, in full-time equivalent terms, there are 14 students per staff member in general upper secondary programmes, similar to than the OECD average. In vocational upper secondary programmes, in full-time equivalent terms, there are 19 students for every teaching staff member (above the OECD average).

Figure 4. Compulsory instruction time in general education (2023)

In hours, in primary and lower secondary education, in public institutions

Note: Instruction hours for each grade refer to average hours per grade for the level of education. Numbers in square brackets refer to the total number of years for primary and lower secondary education.

1. Estimated number of hours by level of education based on the average number of hours per year, as for some subjects, the allocation of instruction time across multiple levels is flexible.

2. Year of reference 2022.

3. The number of grades in lower secondary education is three or four, depending on the track. The fourth year of pre-vocational secondary education was excluded from the calculation.

Countries and other participants are ranked in ascending order of the total number of compulsory instruction hours.

Source: OECD (2023), Table D1.1. For more information see [Source section](#) and [Education at a Glance 2023 Sources, Methodologies and Technical Notes](#) (OECD, 2023^[11]).

- The average age of teachers varies across OECD countries. In some countries, the teaching workforce is much younger than the labour force in general, whereas in others, teachers tend to be older. In Estonia, 51% of teachers in general upper secondary programmes are aged 50 or older, compared to the OECD average of 39%. Teachers in vocational programmes are the same age on average as their general programme peers.
- National/central assessments (standardised tests with no consequence on students' progression through school or certification) are more common at primary and lower secondary levels than at upper secondary level, while most OECD countries conduct national/central examinations (standardised tests with formal consequence) in the final years of upper secondary education. These national/central assessments and examinations take place at different grades and can have different periodicities, their contents may vary over years and/or across students and are not necessarily compulsory for students. In Estonia, there is one national/central assessment at

primary level, and one at lower secondary level. At upper secondary level, there is one national/central examination that each student may be expected to take.
